first orientation, and wherein a position of the second item within the second bar is representative of the incline in the second orientation, wherein the display has a first area and the first bar has a second area, the second area being smaller than the first area.

12. (Cancelled)

13. (Previously presented) The use of a mobile telephone as claimed in claim 1 for measuring an incline.

14. (Previously presented) The use of a mobile telephone as claimed in claim 1 for correcting an incline.

15. (Previously presented) A method comprising:

detecting inclination of a mobile telephone in a first plane; and

controlling a display to display, to a user of the mobile telephone, a bar and an item, at a position within the bar dependent upon the detected inclination, the position of the item within the bar representative of the sense and amount of inclination of the mobile telephone in the first plane, wherein the display has a first area and the bar has a second area, the second area being smaller than the first area.

16. (Previously presented) A method as claimed in claim 15, comprising receiving real-time indications of the detected incline in the first plane and controlling the display to move an item, in real-time, through positions dependent upon the detected inclinations.

17. (Previously presented) A method as claimed in claim 15, wherein the display has a first axis and the method includes controlling the display to display an item at a position along the first axis dependent upon the detected inclination.

18. (Previously presented) A method as claimed in claim 15, comprising detecting inclination of the mobile telephone in a second plane, orthogonal to the first plane, wherein, in the inclinometer mode, the method includes receiving an indication of the detected incline in the second plane and controlling the display to display a further item at a position dependent upon the received indication.

19. (Previously presented) A method as claimed in claim 18, comprising receiving real-time indications of the detected incline in the first and second planes and controlling the display to move the item and the further item, in real-time, through positions dependent upon the received indications.

20. (Previously presented) A method as claimed in claim 18, wherein the display has a first axis and a second axis orthogonal with the first axis and the method includes controlling the display to display the item at a position along the first axis dependent upon the received indication of the detected incline in the first plane and the further item at a position along the second axis dependent upon the received indication of the detected incline in the second plane.

21. (Previously presented) A method as claimed in claim 15, comprising detecting inclination of the mobile telephone in a second plane, orthogonal to the first plane, and when in the

inclinometer mode, the method includes receiving a first indication of the detected incline in the first plane and a second indication of the detected incline in the second plane and controlling the display to display the item at a position dependent upon the received first and second indications.

22. (Previously presented) A method as claimed in claim 21, wherein the display has a first axis and a second axis orthogonal with the first axis and the method includes controlling the display to display the item at a co-ordinate position  $(i,j)$ , wherein the first co-ordinate is dependent upon the received indication of the detected incline in the first plane and second co-ordinate is dependent upon the received indication of the detected incline in the second plane.

23. (Previously presented) A method as claimed in claim 21, comprising receiving real-time indications of the detected incline in the first and second planes and controlling the display to move the item, in real-time, through positions dependent upon the received indications.

24. (Previously presented) A mobile cellular telephone as claimed in claim 1, wherein the mobile cellular telephone emulates a spirit level when it is in the inclinometer mode.

25. (Currently amended) A mobile cellular telephone comprising:

~~a display;~~
